Can energy storage technologies improve the utilization of fossil fuels?

The report provides a survey of potential energy storage technologies to form the basis for evaluating potential future paths through which energy storage technologies can improve the utilization of fossil fuels and other thermal energy systems.

What is the worldwide electricity storage operating capacity?

Worldwide Electricity Storage Operating Capacity by Technology and by Country,2020 Source: DOE Global Energy Storage Database (Sandia 2020),as of February 2020. Worldwide electricity storage operating capacity totals 159,000 MW,or about 6,400 MW if pumped hydro storage is excluded. The DOE data is current as of February 2020 (Sandia 2020).

How do storage generator usage factors differ from capacity factors?

Usage factors for storage generators differ from capacity factors because usage factors are based on gross generation rather than net generation. Energy storage technologies consume more energy than they store and,therefore,always have negative net generation.

What is the current energy storage capacity of a pumped hydro power plant?

The DOE data is current as of February 2020 (Sandia 2020). Pumped hydro makes up 152 GWh or 96% of worldwide energy storage capacity operating today. Of the remaining 4% of capacity,the largest technology shares are molten salt (33%) and lithium-ion batteries (25%).
