Why does a lithium battery have a small voltage difference?

During normal operation of a lithium battery, small differences between cell voltages occur all the time. These are caused by slight differences between the internal resistance and self-discharge rates of each cell. The absorption charge stage fixes these small differences.

What is the SOC voltage chart for lithium batteries?

The SoC voltage chart for lithium batteries shows the voltage values with respect to SoC percentage. A Li-ion cell when fully charged at 100% SoC can have nearly 4.2V. As it starts to discharge itself, the voltage decreases, and the voltage remains to be 3.7V when the battery is at half charge, ie, 50% SoC.

How do I choose a lithium-ion battery pack?

When selecting a lithium-ion battery pack, understanding its voltage characteristics is crucial for ensuring optimal performance and longevity. Three key voltage terms define a battery's operation: Nominal Voltage, Charged Voltage, and Cut-Off Voltage.

Why do lithium ion batteries have a low voltage?

The voltage of the lithium ion battery drops gradually as it discharges, with a steep drop in voltage only towards the end. This rapid drop in voltage towards the end of the discharge cycle is the reason why Li-ion batteries need to be managed carefully to avoid deep discharges that can reduce their cycle life.
