The solar system has one star, eight planets, five dwarf planets, at least 290 moons, more than 1.3 million asteroids, and about 3,900 comets.

The exploration of our solar system is being radically changed since the beginning of operations of the James Webb Space Telescope (JWST) in mid 2022.

The project aims to demonstrate key technologies necessary for robotic and human exploration-class transportation systems as well as highly efficient orbit transfer capabilities for ...

JWST's capabilities are highly complementary to current Solar System missions and will also provide foundations for planning future missions. ...

The solar system has one star, eight planets, five dwarf planets, at least 290 moons, more than 1.3 million ...

In addition to satellite operations, SEP systems are key to enabling future crewed deep space missions. L3Harris is developing advanced electric ...

NASA major projects aim to explore the solar system, advance aeronautic technologies, and return U.S. astronauts to the lunar surface through the Artemis missions.

The spacecraft and systems that we design, build and operate have been a part of exploring every planet in our solar system. They have landed on Mars, executed tiny orbits around ...

In addition to satellite operations, SEP systems are key to enabling future crewed deep space missions. L3Harris is developing advanced electric propulsion systems that will enable ...

These actions - these space operations - exemplify our ability to study celestial objects such as planets, pulsars, galaxies, and even black holes. They are further exemplified by our ability to ...
