Independent estimates indicate that to meet our growing clean electricity demands, we'll need to expand transmission systems by 60% by 2030 and may need to triple those systems by 2050.

In recent years, the telecommunications industry has undergone dramatic transformations, primarily driven by the ever ...

To enhance system efficiency and establish green wireless communication systems, this paper investigates base station sleeping and power allocation strategy based on ...

With millimeter-wave backscatter technology achieving 200uW/cm<sup>2</sup>; energy capture (NTT Docomo trial, May 2024), power base stations could become net energy producers by 2028.

In this paper we assess the benefits of adopting renewable energy resources to make telecommunications network greener and cost ...

Independent estimates indicate that to meet our growing clean electricity demands, we'll need to expand transmission systems by 60% by 2030 ...

Aiming at the problem of mobile data traffic surge in 5G networks, this paper proposes an effective solution combining massive multiple-input multiple-output techniques ...

In today's 5G era, the energy efficiency (EE) of cellular base stations is crucial for sustainable communication. Recognizing this, Mobile Network Operators are actively prioritizing EE for ...

Our study introduces a communications and power coordination planning (CPCP) model that encompasses both distributed energy resources and ...

In recent years, the telecommunications industry has undergone dramatic transformations, primarily driven by the ever-increasing demand for data services and the ...
